## INTRODUCTION

The Memory module is a simple part to replace as it can be done within a few minutes without any hassle. Just remember to keep yourself ground or without static electricity because shocking the module OR the port itself can cause failure.

## Step 1 — Battery

- Lay the laptop with the battery facing towards you.

 Remember to disconnect the AC cable and other power sources from the device before replacing/repairing parts.

## Step 2

- Grab hold of the small battery slider and apply pressure to the right.
- The laptop itself will push the battery out for you once the switch slides all the way to the right.

## Step 3

- Pull the battery out and let go of the battery slider.

## Step 4 — Back Panel

- Use a PH1-screwdriver to loosen the 7mm screw. The screw will not fully come out as it is held by a washer underneath but will come out enough to open it.

## Step 5

- Gently pull the back panel off starting from the battery side towards the back.
- Pull it back as it snaps out of the holding sockets.

⚠ It is preferred to use both hands when pulling the back panel off to prevent bending it out of shape.

## Step 6 — Memory Module

- Locate the memory stick inside.

## Step 7

- On both sides of the module, place a thumb on each of the metallic holding pins.
- Gently pull on the pins to release the spring holding in the module.

## Step 8

- Gently slide the module out of the memory slot.
- ☞ Pay in mind of the module's orientation as it will only go in one way with a little gap in the module to identify orientation.

To reassemble your device, follow these instructions in reverse order.
